WIKIPEDIA

Architectural pattern

An **architectural pattern** is a general, reusable solution to a commonly occurring problem in software architecture within a given context.[1] Architectural patterns are similar to software design pattern but have a broader scope. The architectural patterns address various issues in software engineering, such as computer hardware performance limitations, high availability and minimization of a business risk. Some architectural patterns have been implemented within software frameworks.

Contents

Definition

Even though an architectural pattern conveys an image of a system, it is not an architecture. An architectural pattern is a concept that solves and delineates some essential cohesive elements of a software architecture. Countless different architectures may implement the same pattern and share the related characteristics. Patterns are often defined as "strictly described and commonly available".[2][3]

Architectural style

Following traditional building architecture, a 'software architectural style' is a specific method of construction, characterized by the features that make it notable" (Architectural style). "An architectural style defines: a family of systems in terms of a pattern of structural organization; a vocabulary of components and connectors, with constraints on how they can be combined."[4]

"An architectural style is a named collection of architectural design decisions that (1) are applicable in a given development context, (2) constrain architectural design decisions that are specific to a particular system within that context, and (3) elicit beneficial qualities in each resulting system."[1]

Some treat architectural patterns and architectural styles as the same,[5] some treat styles as specializations of patterns. What they have in common is both patterns and styles are idioms for architects to use, they "provide a common language"[5] or "vocabulary"[4] with which to describe classes of systems.

The main difference is that a pattern can be seen as a solution to a problem, while a style is more general and does not require a problem to solve for its appearance.

Examples

Here is a list of architecture patterns, and corresponding design patterns and solution patterns.

Sub-Domain Area	Architecture Pattern Name	Design Patterns	Solution Patterns	Related Patterns
Data Integration/SOA	▪ ETL (Data Extraction Transformation & Loading)	▪ Change Data Capture ▪ Near Real-Time ETL ▪ Batch ETL ▪ Data Discovery	▪ Error handling ▪ Job scheduling ▪ Data validation ▪ Slowly Changing Dimensions Load	▪ EAI ▪ Master Data Hub ▪ Operational data store (ODS) ▪ Data Mart (http://com mons.wikimedia.org/w iki/File:Datamart_Arch itecture_Pattern.jpg#fil e) ▪ Data Warehouse
	▪ MFT			
	▪ EAI/ESB	▪ Publish/subscribe ▪ Request/reply ▪ Message Exchange Patterns	▪ One-Way ▪ Synchronous Request/Response ▪ Basic Callback ▪ Claim Check	▪ SOA
Data Architecture	▪ Transaction Data Stores (TDS/OLTP) ▪ Master Data Store ▪ Operational Data Store ▪ Data Mart ▪ Data Warehouse	▪ Custom Applications Databases ▪ Packaged Application Databases		▪ ETL ▪ EAI ▪ SOA
Business Intelligence	▪ Transactional Reporting ▪ Operational Reporting ▪ Analytical Reporting	▪ Transactional Reporting Data Access ▪ Operational Reporting Data Access ▪ Analytical Reporting Data Access ▪ Analytical Dashboard Data Access ▪ Operational Dashboard Data Access ▪ Data Mining	▪ Real-Time Dashboards ▪ In-Memory Analytics ▪ Statistical Analysis ▪ Predictive analytics	▪ ETL ▪ EAI ▪ TDS ▪ Operational Data Store ▪ Data Mart
Master data management	▪ Master Data Hub	▪ Master Data Replication ▪ Master Data Services ▪ Master Data Synchronization		▪ Change Data Capture ▪ EAI ▪ STD

Data Modeling	- Dimensional Data Modeling - E-R Data Modeling	- Modeling Standards - Naming Conventions		

Some additional examples of architectural patterns:

- Blackboard system
- Broker pattern
- Event-driven architecture
- Implicit invocation
- Layers
- Microservices
- Model-view-controller, Presentation-abstraction-control, Model-view-presenter, and Model-view-viewmodel
- Entity–component–system
- Multitier architecture (often three-tier or n-tier)
- Naked objects
- Operational Data Store (ODS) (http://commons.wikimedia.org/wiki/File:Operational_Data_Store_Architecture_Pattern.jpg)
- Peer-to-peer
- Pipe and filter architecture
- Service-oriented architecture
- Space-based architecture
